3D Paper Star

This easy 3D light up paper star will have your house brightly twinkling like the night sky!

Follow the video to help you make the star. Below is a required materials list and a step–by–step to help you along while watching the video.
Merry Christmas!

Materials:
Coloured paper, scissors, glue, a hole puncher, a piece of string and some wire battery powered fairy lights.

Step-by-Step

1. Follow the video to make your stars. You can choose any colour. To make one 3D star you will need to cut out 2 paper stars.
2. Once these are cut out use the hole puncher to punch a few holes into your star shape. Punch two holes in to one point of your stars.
3. Cut a small line into the inside corners of your star. Use these cuts to create small folds into the sides of your star.
4. Use these folds to attach one side of the star to the other using a glue stick.
5. Using your pre-punched holes begin to feed the wire fairy lights into the star.
6. Use your piece of twine or string and feed through your two pre-punched holes. Tie this into a loop and use this to hang up your star light!
